Unlike Lightroom, which is a work-group managed program, Photoshop is a standalone program. Photoshop has its own creative overlay called Bridge, and Photoshop doesn't quite understand your work-flow. It treats the Photos folder as a folder of raw files to open, rather than a folder of folders. This means that if you're working on a photo in Photoshop and decide to scrap it, Bridge will keep a copy even if it's not a PSD. Bridge is similarly quite removed from PSD files. It will handle many alternative file extensions but only if you ask it to. Other than that, Bridge is not quite the companion that Lightroom's Organizer can be to its images. In addition, Photoshop is not a universal viewer. The maximum size of any PSD file is 3 GB, which is fine for now, but you will soon find yourself saying too large for any modern computer. The technology is here, but more could have been done to help the user and not just the developer. The funny part is, as I mentioned earlier, Photoshop could do a better job of addressing this File Format Situation. Back when Photoshop was pushed as a "professional" format in 2009, that value was pushed by third-party support. In fact, this push for the Photoshop Format was alive and well until recent versions of the software. Adobe has acknowledged that it should support other file formats that do exist in the era of Thunderbolt connectivity. I hope that this is just what Adobe is doing, that it is fighting to please users and not just developers, and that the developer support is strong enough to prevent Photoshop actually betting on.psd files.
